

Project #1 Addendum

Your task for Project #1 is to apply the knowledge presented in the principal reference, You are what you document, to a **specialized coprocessors that enhances the core functionality of a CPU**. The specific type of coprocessor that you choose is up to you.

In particular, you are to provide *examples* of documentation for the following:

- Written documentation (just the *introduction to a reference guide* or a *ReadMe*),
- Code documentation (just a few *code snippets*), and
- Community documentation (use your imagination).

This may seem to be too much to do before the deadline (one week), but you are only to provide examples. Most of the work is in researching the topic – getting acquainted with the subject enough through research such as reviewing the literature, defining the topic, categorizing material, comparing and contrasting, *etc.*

NOTE: LaTeX is not required for this exercise.
